

Key Findings from 2017 WA State Syringe Exchange Health Survey:

Interest in Reducing or Stopping Methamphetamine Use

Vanessa McMahan
Research Coordinator
University of Washington

Study Aims

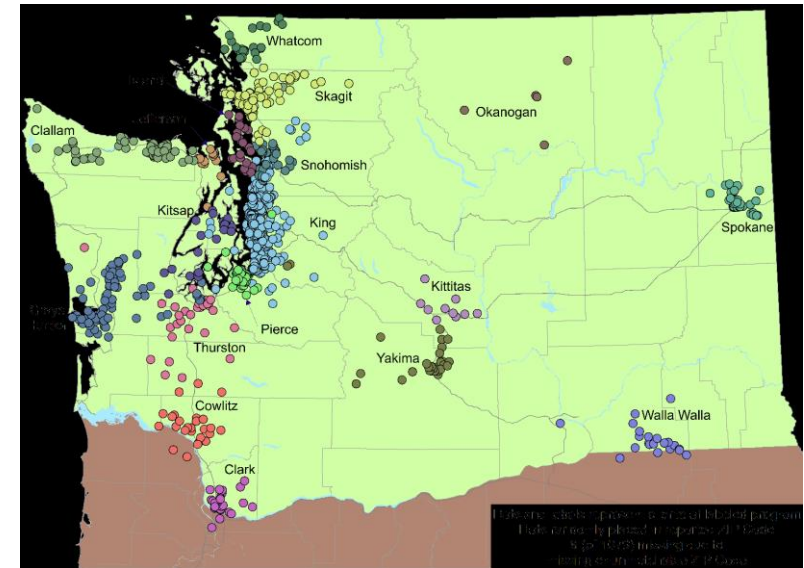

- 1) Identify if sociodemographic characteristics, drug use behavior, and concern about mental health are associated with interest in reducing or stopping meth use among people whose main drug is meth.
- 2) Explore types of help that participants would want who are interested in reducing or stopping their meth use.
- 3) Contrast findings with participants whose main drug is an opioid.

Data Source

2017 WA State Syringe Exchange Health Survey

50 items, paper-based

- Demographic characteristics
- Sex partner gender
- Drugs used
- Injection-related infections
- Source of health care
- Concern about mental health
- Drug treatment

Respondents by zip code and SEP location

Image from ADAI report

Outcome

How interested are you in reducing or stopping your stimulant / opioid use?

Not interested vs Interested (Very & Somewhat)

Not sure (not in primary analysis)

Covariates

Demographic

Age
Race
Gender
MSM
Housing status
Rural/urban location
Health insurance status
Legal monthly income
(before taxes)

Drug Use

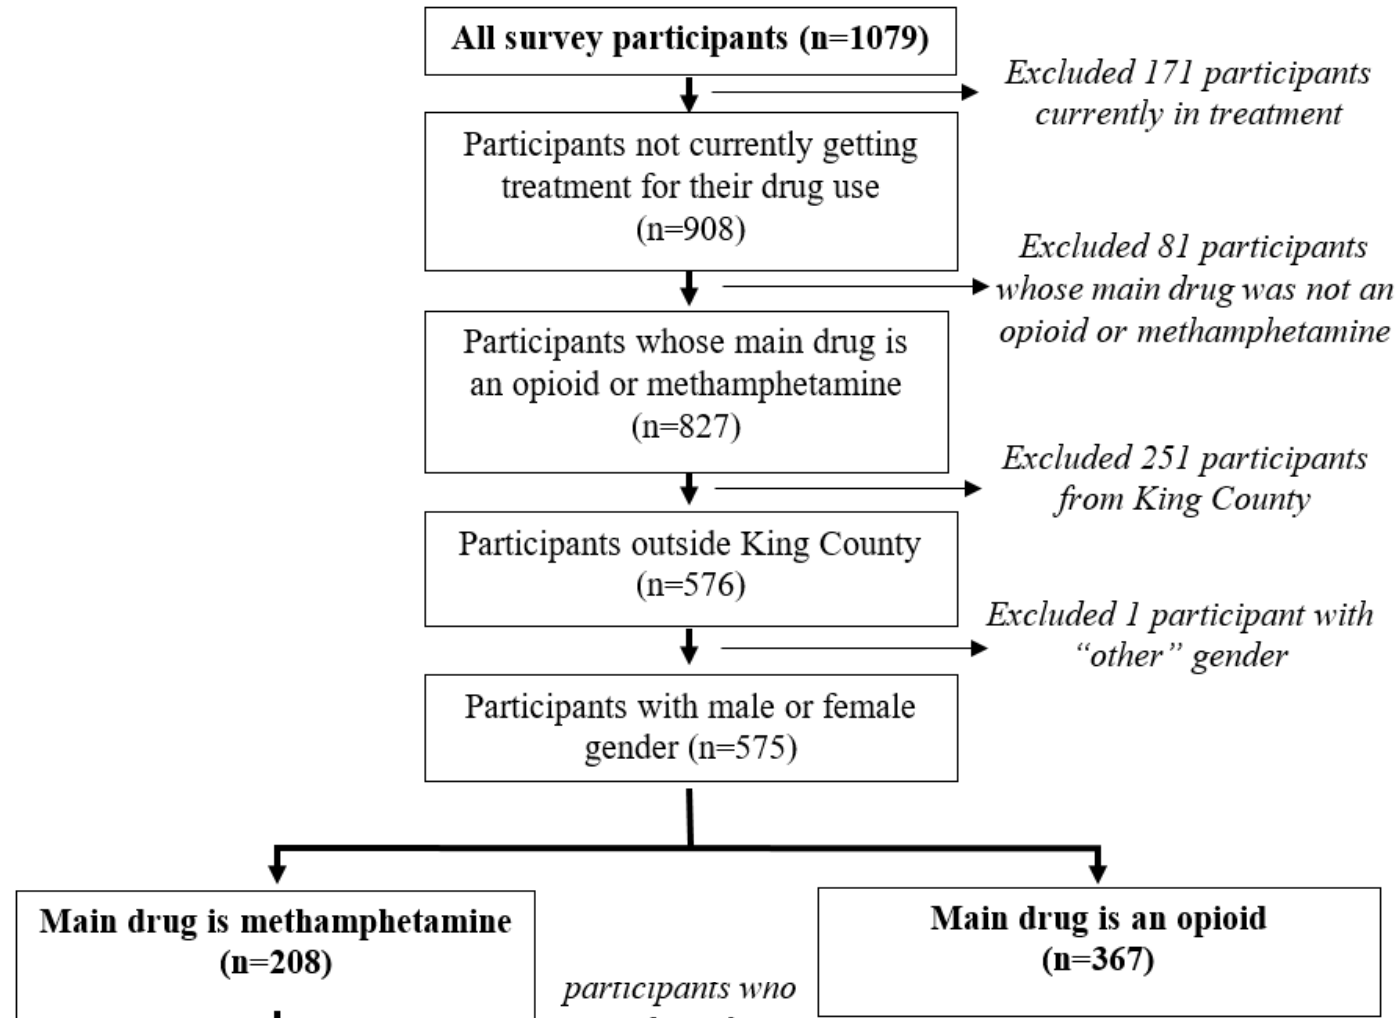

Overamping/Overdose
Injection-related infections
Other drugs used

Other

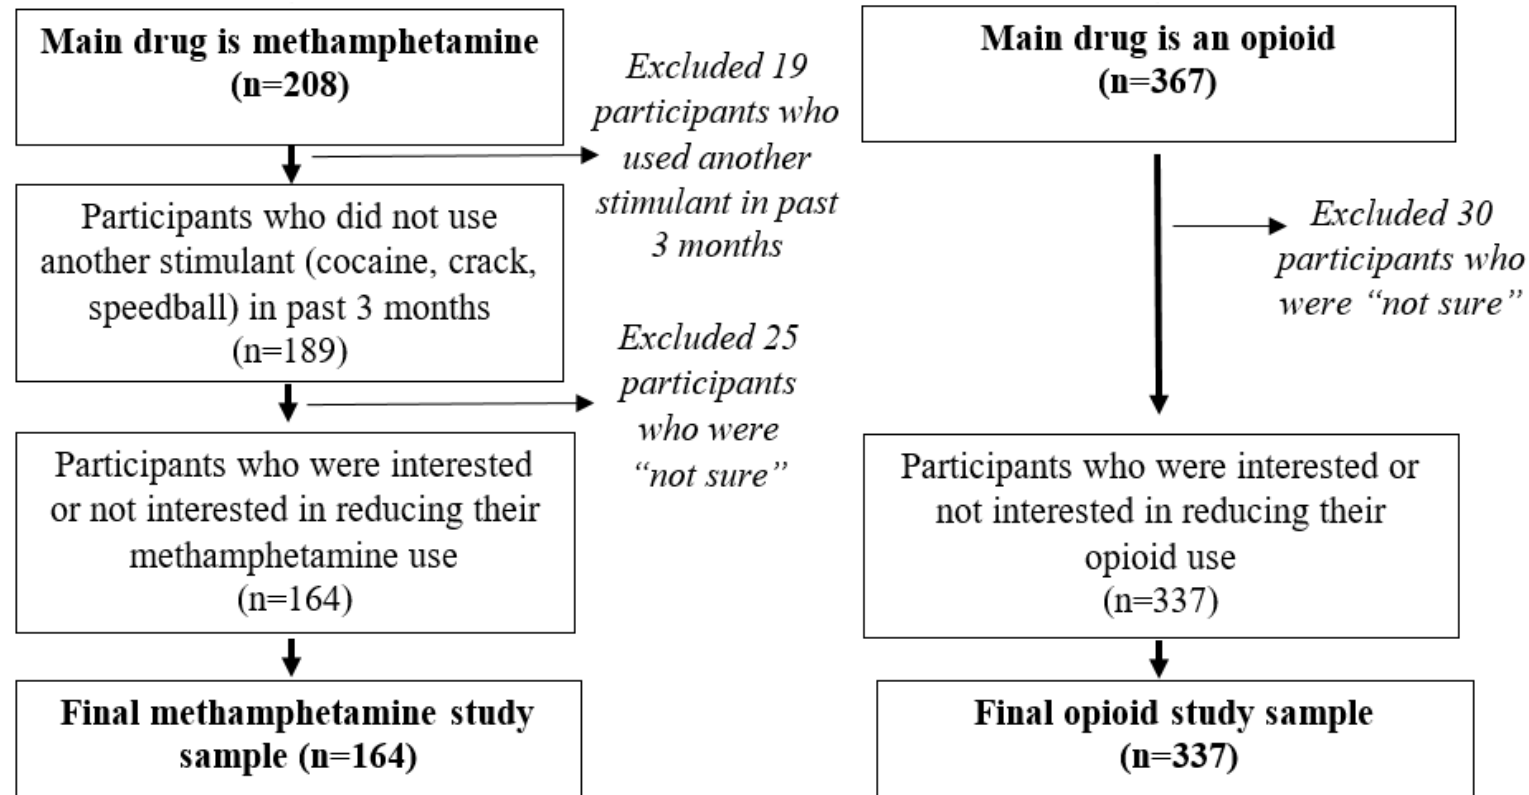

Past year source of health
care
Concern about mental health
Past year incarceration

Sample Selection

Sample Selection

Results: Reported Drug Use in Past 3 Months by Main Drug Used (n=501)

Main Drug Used [†]	Total	Drugs Used in 3 Past Months									
		Methamphetamine (n=433)		Heroin (n=391)		Prescription Opiates (n=127)		Fentanyl (n=48)		Goofball (n=205)	
		%	%	n	%	n	%	n	%	n	%
Methamphetamine	164	164	100%	55	34%	18	11%	7	4%	37	23%
Heroin	331	268	81%	331	100%	103	31%	40	12%	167	50%
Prescription Opiates	6	1	17%	5	83%	6	100%	1	17%	1	17%
[†] No participants reported fentanyl or goofballs as their main drug.											

Results: Demographic Characteristics by Main Drug (n=501)

Characteristics [†]	Total (501)		Methamphetamine (164)		Opioids (337)		p value

Very/Somewhat	85		29	34%	56	66%	

Results: Significant Bivariate Associations with Interest in Reducing or Stopping Use Among Participants Whose Main Drug is an Opioid (n=337)

	Opioids								
Characteristics	Total (337)		Not Interested (54)			Interested (283)			<i>p</i> value
	n		n	(%)		n	(%)		
Insurance type *									.032
Public/Government	278		40	14%		238	86%		
Private	18		6	33%		12	67%		
Other	0		0	0%		0	0%		
Concerned about Mental Health † *									<.001
Not at all	122		33	27%		89	73%		
Very/Somewhat	213		21	10%		192	90%		

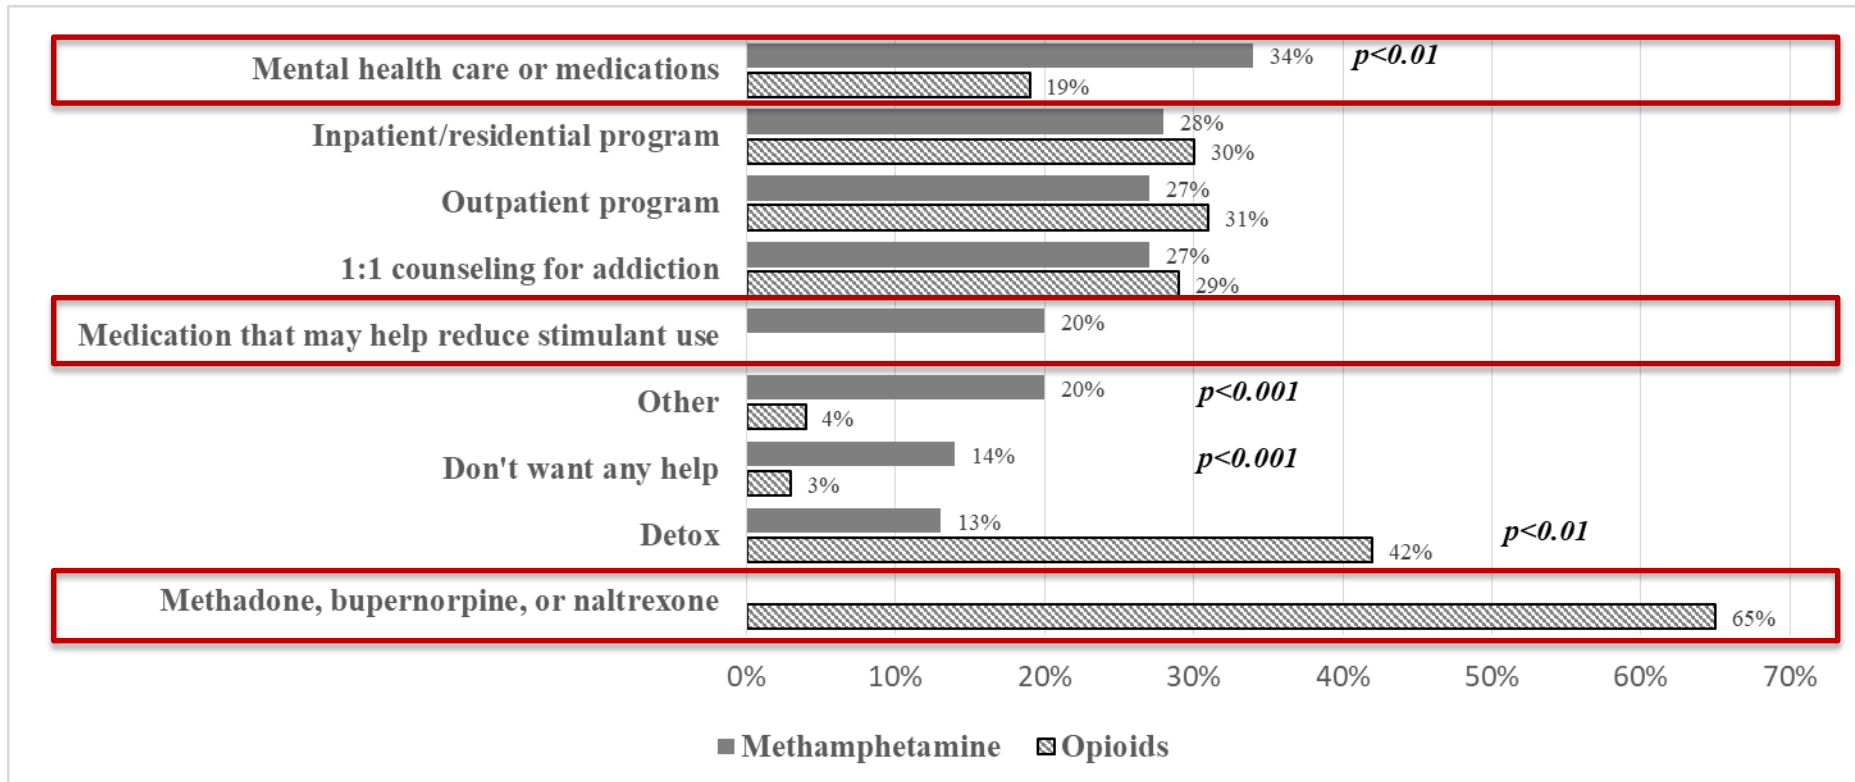

Results: Multivariable Associations with Interest in Reducing or Stopping Use (n=501)

Concern about mental health (depression, anxiety, or some other mental health issue) was associated with

- 3.04 times the odds of interest in reducing or stopping meth use (95% CI: 1.52-6.06)
- 3.00 times the odds of interest in reducing or stopping opioid use (95% CI: 1.61-5.60)

Results: What Types of Help People Wanted to Reduce Use Among Those Interested (n=369)

Implications

- > People who use methamphetamine should be asked about their interest in reducing or stopping their use and supported as appropriate.
- > Mental health practitioners should be involved in care provision for people who use methamphetamine.
- > There is interest in medications to reduce meth use – this research should be a priority.

Future Work

- > Better understand the relationship between mental health and methamphetamine.
- > Assess depression vs anxiety.
- > Collect data on frequency of meth use.
- > Assess interest in reducing vs stopping use.
- > Include people who use meth via non-injection ways and individuals outside of SEPs.
